

FLEX-A-GARD

POLYURETHANE BAR SCREEN RAKES

1 Flex-A-Gard steel reinforced polyurethane bar screen rakes are designed to operate in the toughest conditions that can occur in the waste water plant. They are produced by encapsulating a metal support bar in polyurethane.

2 Because polyurethane rakes are 2/3rds lighter than the steel rakes they replace, they are easier and faster to install. This quality makes working in the harsh environment of the bar screen less of a time consuming, back breaking chore.

3 Reduction of the weight of the rakes also adds considerable life to the chain and sprocket system that pulls them. 2 to 3 times the life of a conventional system is not uncommon.

4 Urethane rakes are resistant to most chemicals found in waste water. They will not rust.

5 Rakes are available in sectional design. This makes replacement a simple task.

6 Hooked tooth design greatly adds to the rakes ability to remove trash from the rack.

7 Rakes can be custom designed for your application, be it front clean or back clean.

8 With the use of polyurethane rakes you can now use non-metallic chain on your bar screen.

Flex-A-Gard Rakes are constructed from polyurethane molded around an L-shaped steel support bar. Rakes are constructed in such a manner that the teeth mesh properly with the bar screen rack assembly. Rakes are attached to an angle bracket manufactured from 304 stainless steel. All hardware is 304 stainless steel.
